## Stable Matching

## References:

Algorithm Design - Chapter 1 section 1

## Analysis of the G-S algorithm

- Does the program always terminate?
- Does it return a perfect matching?
- Is the matching stable?

## Example of the G-S algorithm

Men's Preference					
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
$m_1$	$w_2$	$w_3$	$w_4$	$w_5$	$w_1$
$m_2$	$w_1$	$w_4$	$w_5$	$w_2$	$w_3$
$m_3$	$w_1$	$w_5$	$w_4$	$w_3$	$w_2$
$m_4$	$w_2$	$w_1$	$w_3$	$w_4$	$w_5$
$m_5$	$w_4$	$w_3$	$w_5$	$w_1$	$w_2$

Women's Preference					
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
$w_1$	$m_5$	$m_3$	$m_2$	$m_1$	$m_4$
$w_2$	$m_2$	$m_1$	$m_4$	$m_5$	$m_3$
$w_3$	$m_1$	$m_5$	$m_2$	$m_3$	$m_4$
$w_4$	$m_4$	$m_1$	$m_3$	$m_2$	$m_5$
$w_5$	$m_3$	$m_4$	$m_1$	$m_2$	$m_5$

- Run the C-S algorithm on this example:
  - o Round 1:  $m_1$  and  $m_4$  propose to  $w_2$ ,  $w_2$  engaged with  $m_1$  and rejected  $m_4$ .  
 $m_2$  and  $m_3$  propose to  $w_1$ ,  $w_1$  engaged with  $m_3$  and rejected  $m_2$ .  
 $m_5$  proposes to  $w_4$ , and  $w_4$  engaged to  $m_5$ .  
 You have pairs:  $(m_1, w_2), (m_3, w_1), (m_5, w_4)$ .  $m_2$  and  $m_4$  are rejected.
  - o Round 2:  $m_2$  proposes  $w_4$ ,  $w_4$  rejected  $m_5$  and engaged with  $m_2$ .  
 $m_4$  proposes  $w_1$ ,  $w_1$  rejected  $m_4$  and remain engaged with  $m_3$ .  
 You have pairs:  $(m_1, w_2), (m_2, w_4), (m_3, w_1)$ .  $m_4$  and  $m_5$  are rejected.
  - o Round 3:  $m_4$  and  $m_5$  propose to  $w_3$ ,  $w_3$  engaged with  $m_5$  and rejected  $m_4$ .  
 You have pairs:  $(m_1, w_2), (m_2, w_4), (m_3, w_1), (m_5, w_3)$ .  $m_4$  is rejected.
  - o Round 4:  $m_4$  proposes  $w_4$ ,  $w_4$  rejected  $m_2$  and engaged with  $m_4$ .  
 You have pairs:  $(m_1, w_2), (m_3, w_1), (m_4, w_4), (m_5, w_3)$ .  $m_2$  is rejected.
  - o Round 5:  $m_2$  proposes to  $w_5$ , and  $w_5$  engaged to  $m_2$ .  
 You have pairs:  $(m_1, w_2), (m_2, w_5), (m_3, w_1), (m_4, w_4), (m_5, w_3)$ .
  - o No more proposal can be made, the algorithm end.
  - o Therefore, we got a "stable" matching:  
 $(m_1, w_2), (m_2, w_5), (m_3, w_1), (m_4, w_4), (m_5, w_3)$ .
- Review the analysis on what we did last class
  - o A woman ends up engaged to the highest ranked man, highest ranked of all men who proposed to her.
  - o During the running of the algorithm, the ranking of women in the preference list of the man who proposes gets worse.
  - o [Theorem] For  $n$  men and  $n$  women, the G-S algorithm terminates after at most  $n^2$  iterations in the loop.
  - o [Lemma] If a man is free at some point in the execution of the algorithm, then there is a woman to whom he has not yet proposed.

## Analysis of the G-S algorithm

- [Lemma] The G-S algorithm returns a perfect matching.

Proof:

- o G-S algorithm will return a matching.
    - Since a woman is either free or engaged with only one man, so every woman would appear at most once in the pairing.
    - A man who engaged does not propose, so a man is either free or engaged to a woman, so every man would appear at most once in the pairing.
  - o To show the matching is perfect. We can proof it by contradiction:
    - Assume the algorithm terminates with a free man (not perfect matching).
    - Then, by previous lemma, there is a woman whom that the free man has not yet propose to.
    - And we know that the algorithm terminates only if there is no more proposal, which means there is no free man who has not yet proposed to every woman.
    - This contradicts the assumption; we have a perfect matching.
- [Theorem] The result of Gale-Shapley algorithm is a stable matching.

Proof by contradiction:

- o Assume that we have  $(m, w')$  and  $(m', w)$ ,  $m, m' \in M, m \neq m'; w, w' \in W, w \neq w'$ , in our matching, and there is an unstable pair  $(m, w)$ .
  - which  $m$  and  $w$  prefer each other more than their current partners.
- o  $m$  prefer  $w$  to  $w'$ , which implies  $m$  must propose to  $w$  before  $w'$ .
- o Then  $w$  was proposed by  $m$ , but didn't end up with him.
  - $w$  will not end up with  $m$  for the following reasons:
    - 1) she was already engaged with someone better.
    - 2) she temporarily engaged to  $m$ , but rejected him later for someone better.
  - In both cases,  $w$  will end up with someone better than  $m$ , which will contradict the fact she prefer  $m$  to  $m'$  (her current partner).

## Analysis of the G-S algorithm

- Does the G-S algorithm (men propose, women reject) favor men or women?
  - o In G-S algorithm,
    - the partner for women can only get better.
    - the partner for men can only get worse.

- In the previous example, we did men propose on G-S algorithm. Let's find another stable matching by women propose.

Men's Preference					
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
$m_1$	$w_2$	$w_3$	$w_4$	$w_5$	$w_1$
$m_2$	$w_1$	$w_4$	$w_5$	$w_2$	$w_3$
$m_3$	$w_1$	$w_5$	$w_4$	$w_3$	$w_2$
$m_4$	$w_2$	$w_1$	$w_3$	$w_4$	$w_5$
$m_5$	$w_4$	$w_3$	$w_5$	$w_1$	$w_2$

Women's Preference					
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>	5 <sup>th</sup>
$w_1$	$m_5$	$m_3$	$m_2$	$m_1$	$m_4$
$w_2$	$m_2$	$m_1$	$m_4$	$m_5$	$m_3$
$w_3$	$m_1$	$m_5$	$m_2$	$m_3$	$m_4$
$w_4$	$m_4$	$m_1$	$m_3$	$m_2$	$m_5$
$w_5$	$m_3$	$m_4$	$m_1$	$m_2$	$m_5$

- o Round1:  $w_1$  proposes to  $m_5$ ,  $w_2$  proposes to  $m_2$ ,  $w_3$  proposes to  $m_1$ ,  $w_4$  proposes to  $m_4$ , and  $w_5$  proposes to  $m_3$ .  $m_1$  will engage with  $w_3$ ,  $m_2$  will engage with  $w_2$ ,  $m_3$  will engage with  $w_5$ ,  $m_4$  will engage with  $w_4$ , and  $m_5$  will engage with  $w_1$ . No men get rejected; algorithm terminates.

- Compare the result with men propose.
  - o For men propose, we got the stable matching:  
 $(m_1, w_2), (m_2, w_5), (m_3, w_1), (m_4, w_4), (m_5, w_3)$ .
  - o For women propose, we got the stable matching:  
 $(m_1, w_3), (m_2, w_2), (m_3, w_5), (m_4, w_4), (m_5, w_1)$ .
  - o If you circle the results on the preference tables, you will see that men get better choices in the men propose model. And women get better choices in the women propose model. In this particular example, women will all get their top choice in the women propose version.
- We found that the G-S algorithm actually favors the men (proposed side) then women (rejected side).

### Analysis of the G-S algorithm

- Let's look from men's perspective.
  - o For a man  $m$ ,  
 $valid(m) = \{set\ of\ women\ w, that\ m\ is\ paired\ with\ w\ in\ some\ stable\ matings\}$ , and  
 $best(m) = the\ woman\ that\ most\ preferred\ by\ m\ in\ valid(m)$ .
- Prove that every man will match with his best valid partner.  
 i.e., G-S algorithm returns a stable matching  $S^* = \{(m_i, best(m_i)) \mid m_i \in M\}$ .  
 Proof by contradiction:
  - o Assume there is a pair  $(m, w)$  in the matching  $S^*$  such that  $w \neq best(m)$ .
  - o Since men propose in decreasing order,  $m$  must be rejected by  $best(m)$ , which either  $best(m)$  engaged to a man  $m'$  better than  $m$ ,  
or  $best(m)$  was engaged to  $m$ , but rejected him later down the line for someone better,  $m'$ .  
 In both cases,  $best(m)$  prefer  $m'$  to  $m$ .
  - o Since  $best(m)$  is a valid partner for  $m$ , then there must exist a stable matching  $S'$  that  $(m, best(m)) \in S'$ .
  - o Consider  $m'$  as the man engaged to  $best(m)$  in  $S^*$ , since  $best(m)$  is paired with  $m$  in  $S'$ ,  $m'$  must be paired with someone else,  $w'$ , that  $w' \neq best(m)$ .  $m'$  must prefer  $best(m)$  to  $w'$ , since  $(m', best(m)) \in S^*$ .
  - o In  $S'$ , we have  $(m, best(m))$  and  $(m', w')$ . But  $(m', best(m))$  is an unstable matching, they prefer each other more than their current partners in  $S'$ , which contradict that  $S'$  is a stable matching.
- Let's look from women's perspective.
  - o For a woman  $w$ ,  
 $valid(w) = \{set\ of\ men\ m, that\ w\ is\ paired\ with\ m\ in\ some\ stable\ matings\}$ , and  
 $worse(w) = the\ man\ that\ least\ preferred\ by\ w\ in\ valid(w)$ .
- Prove that every woman will match with her worse valid partner.  
 i.e., G-S algorithm returns a stable matching  $S^* = \{(worse(w_i), w_i) \mid w_i \in W\}$ .  
 Proof by contradiction:
  - o Assume there is a pair  $(m, w)$  in the matching  $S^*$  such that  $m \neq worse(w)$ .
  - o Then there is a stable matching  $S'$  that  $(m', w) \in S', m' = worse(w)$ ,
    - i.e.,  $w$  prefer  $m$  to  $m'$ .
  - o In  $S'$ , there exist a  $w'$  such that  $(m, w') \in S', w' \neq w$ .
  - o By previous theorem,  $w = best(m)$ , since  $(m, w) \in S^*$ .
    - Which  $m$  prefer  $w$  to  $w'$ .
  - o We have  $(m', w) \in S'$  and  $(m, w') \in S'$ , but  $(m, w)$  is an unstable matching, they prefer each other more than their current partners in  $S'$ , which contradict that  $S'$  is a stable matching.

## Problem Statement vs Algorithm

What's the difference between algorithm and problem statement?

- In algorithm class, many students mix the algorithm with the problem statement.
- Algorithm is the way to solve a problem, and there could be many ways to solve a problem. We should have the solution separate from the problem statement. Problem Statement are referring to the question. What's the input? What's the required output?  
How we approach and solve the problem is the algorithm.
- Stable matching is our first question. Hopefully this gives you an idea of what a problem statement looks like, what is the input, what is the output.
- And when you come up with an algorithm, you need to prove two things:
  - 1) prove that it's correct that our algorithm does the job, and
  - 2) prove that it does the job in a reasonable time, i.e., polynomial time. If it takes forever, then the algorithm is useless, even if it's correct.
- Other variants: Men-Women-Cats (3D matching).

## Assignment/Project [5 %]

- Implement the G-S algorithm.

Men's Preference				
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>
$m_1$	$w_2$	$w_3$	$w_4$	$w_1$
$m_2$	$w_1$	$w_4$	$w_2$	$w_3$
$m_3$	$w_1$	$w_3$	$w_4$	$w_2$
$m_4$	$w_2$	$w_1$	$w_3$	$w_4$

Women's Preference				
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>
$w_1$	$m_1$	$m_3$	$m_2$	$m_4$
$w_2$	$m_2$	$m_1$	$m_4$	$m_3$
$w_3$	$m_1$	$m_3$	$m_2$	$m_4$
$w_4$	$m_4$	$m_1$	$m_3$	$m_2$

- 1) Run this example on your program, show evolution of each round.
- 2) Run this example again with the roles of men and women swapped (women propose, men reject), show evolution of each round.
- 3) Compare your result in part (1) and (2).

### - Submission instruction:

- You can implement the algorithm in any language you prefer.
- I will suggest you put your code, comments, and answer to above questions on a Jupyter Notebook. However, it's not mandatory. You can have also sent the coding file with your implementation and answer the questions in email.
- You will submit your work via email with the subject "**CS323 GS algorithm**". Please sent the email from your school email to [xinying.chyn@qc.cuny.edu](mailto:xinying.chyn@qc.cuny.edu).
- In the email, please include the following:
  - a. explanation of how do your program import input.
  - b. outputs of the about example for part (1) and (2)
  - c. Your answer to part (3).
  - d. the coding file with your implementation.
- It's due Friday, February 18, 2022. No late submission.

What to expect or prepare for the next class:

- Graph
